

# SOME POVERTY ISSUES IN PAKISTAN: AN EMPIRICAL ANALYSIS

Mahboob Ellahi\*

---

**ABSTRACT:** A pragmatic approach for income enhancement was adopted in 1960s with a notion "*take care of GNP and it will take care of poverty itself*" (Dr. Mahboob-ul-Haq) followed by its reversal in 1980s. Current policy is to combat poverty and revive economic growth. Emphasis of the *first policy package* was to boost farm output by investing in agriculture (a supplier of raw materials). The *second policy package* was to invest for it by shifting to value adding industries, notably textiles, to develop backward and forward linkages, increase income, employment and share in global trade. This was to continue for other commodities and tailoring output according to the economic principles to sustain increased welfare, which was not achieved.

## 1. INTRODUCTION

Poverty and its alleviation has been focal point in the economic development process. A pragmatic approach, under Dr. Mahboob-ul-Haq's notion: "*take care of gross national product (GNP) and it will take care of poverty itself*", was adopted in the Second and Third Five Year Plans (1960-65 and 1965-70), which was reversed in 1980s. Now a Poverty Reduction Strategy Paper (PRSP) is designed to accelerate economic growth and combat poverty [Government of Pakistan (2003)], which is a continuation of Interim-PRSP [Government of Pakistan (2001)].

Rural population declined from 82 per cent of the total in 1951 (Census of Pakistan 1951) to 67 per cent in 1998 (Census Report of Pakistan 1998) and poverty increased as shown by Gini Coefficient and other indicators. For instance, share of middle income group (60 per cent of population) reduced from 50 per cent of total income in 1960s to 44 per cent in 1990s (Economic Survey 2002-03) and benefited high income group (population's 20 per cent).

Agriculture's share in gross domestic product (GDP) at market prices (MP) declined to 23 per cent in 2003-04 from 52 per cent in 1950-51. Its employment share declined from 65 per cent in 1951 (Census of Pakistan 1951) to 42 per cent in 2004 (Labour Force Survey 2000-02), while those of construction, utilities, transport and commerce went up from 10 to 25 per cent. Dimensions of poverty issue have changed, but rural areas are the major pockets despite a boost in farm output, which requires an analysis in the national and global contexts [Hussain (2003)].

The technology comprising hybrid seeds, chemical fertilizers, plant protection, tubewells and tractors were introduced in 1960s. Temporal increase in first three was manifold and that in irrigation was more than twofold [Ellahi (2002)]. Average annual growth rate of Tractors was five per cent (Pakistan Censuses of Agricultural Machinery, 1984 and 1994).

---

\* Joint Chief Economist, Planning and Development Department, Government of Punjab, Lahore.

Technical break-through changed crop production, wages and employment. Other factors affecting income and employment were land reforms, works programmes, foreign labour market, agro-based industries, etc. Bio-chemical and irrigation inputs increased labour use, while tractors worked otherwise [Ellaahi (2002)]. Land reforms, led to increased eviction of tenants, reduced employment and increased poverty. Hence, this study is to review core issues, policies adopted, its own focus, analysis, conclusions and policy recommendations.

## 2. THE CONCEPT AND MEASUREMENT OF POVERTY

Following Malthusian ideology, Iqbal (1903) discussed causes, outcomes and measures to check poverty. He regarded it as a root cause of crimes, such as theft, robbery, murder, prostitution [women's glaring role, in this era, is brilliantly painted by Baber (1999)], etc. due to expanding population, emerging wants, resource limitations and the law of diminishing returns. This concept has now changed due to socio-political, cultural, techno-economic relationships, globalization and many other factors. For instance, poverty is influenced by access to food, water, sanitation, education, health and other social facilities. Nature of crimes has changed, such as drug addiction, terrorism, cultural vulgarity, arrogance, fatal games, *ghundaism* socio-political patronage to crime and drugs, sectarian and extra judicial killings, ethnic violence, kidnapping for ransom, robberies, insecurity of life and property, and break-down of social and moral values.

Poverty measures include calorie-based income and Gini Coefficient. Poverty line is an income level providing 2250 calories per person, i.e. 2450 in rural and 2150 for urban areas (Economic Surveys) and latter measures income distribution with zero value for perfect equality and one for otherwise. International Fund for Agricultural Development (2000) and World Bank (2001) use US\$ 1 and 2 per capita per day. Data on former two measures are set out in Table 1.

**Table 1: The Poverty Indicators**

	Per cent of population below poverty line			The Household Gini Coefficient		
	Total	Rural	Urban	Total	Rural	Urban
1963-64	40.24	38.94	44.53	0.386	-	-

1999-00	33.50	-	-	-	-	-

Sources: i) Rashid and Kemal (1997), Qureshi and Arif (1999) and SPDC (2000) for population percentage below poverty line.ii) Economic Survey 2002-2003 and previous issues for household Gini Coefficient.

As seen above, per cent of population below poverty line increased from 40 per cent in 1963-64 to 47 per cent in 1969-70, reduced in 1970s/1980s and went up in 1990s. Income distribution improved in mid-1960s/1980s and otherwise in 1970s/1990s.

The modern economics recognizes that utility (anti-poverty) is maximized by consuming goods and services and availing leisure. This was initiated by Becker (1965) Lancaster (1966) and Muth (1966) and adopted by Banskota and Evenson (1978), Rosenzweig (1980 and 1984), Low (1986), Huffman (1980 and 1987), Sharma (1988), Ellahi (1992) and Ellahi and Mahboob (2002a and 2002b). As consumption of goods and services and leisure are influenced mainly by income and prices, change in their volume and composition is a measure of poverty.

### **3. POLICIES FOR POVERTY ALLEVIATION**

To improve income and employment, Village, Agricultural and Industrial Development Programme (First Five-Year Plan 1955-60) included use of public funds, local labour and skills for socio-economic infrastructure. It was renamed as Rural Works Programme in the Second and Third Five Year Plans 1960-65 and 1965-70 and followed by the People Works and Integrated Rural Development Programmes in 1972. The outcomes were agro-based industries and non-farm activities, i.e. commercial activities and works absorbing skilled and un-skilled workers. The Fifth (1978-83) and Sixth (1983-88) Five Year Plans shifted emphasis to rural development through inputs, services and loans for small industries. The on-going PRSP is comprised of four pillars, i.e. (i) an accelerated economic growth and macroeconomic stability, (ii) improving governance, (iii) investing in human capital and (iv) targeting poor and vulnerable groups.

### **4. THE STUDY FOCUS AND ANALYTICAL FRAMEWORK**

The level of farm output and its price are major determinants of farm income. Export prices, in US Dollar (US\$), play a vital role to determine the domestic ones and general welfare. Pakistan's import-export turn-over of about US\$ 27 billion has a substantial impact on domestic economy, which requires a study of the effects created by export prices for domestic ones and labour wages in the temporal context. In January 1982, one US\$ was worth 9.91 Pak. Rupees (PRS), which climbed up to about PRS 67 in September, 2001 and export prices, in US\$, showed a continuous decline since 1981-82. Thus, 1980-81 was taken as base and 2003-04 as terminal year. In view of time and space limitations, scope of this study is limited to GDP (MP), public debts, wages and major crops, i.e. wheat, rice, cotton and sugarcane, which account for about one third of agricultural output and a major share of Pakistan's export earnings. Sugarcane and wheat are well-spread, while cotton and rice are confined to their agro-climatic zones.

Empirical analysis includes over-time changes in different variables and their average annual growth rates using data on area, yield, production, exports, prices, in PRS and US\$, and share of each crop in their total area. Rice exports include basmati and others, while those selected from cotton group are lint, yarn and thread, cloth and waste. Analysis also covers GDP, exports (all), public debts and labour wages. To analyze relationships of export earnings (all and those from selected commodities) and public debts with GDP and exports (all), year-wise ratios of former variables to the latter were worked out. Their monetary values and physical quantities, in the base and terminal years, were also compared to assess impacts of the policies adopted.

There are multiple support/domestic prices, except for wheat. For cotton, prices for common varieties (B-557, F-149, Niab-78 and CIM-109) were used and those for sugarcane, basmati and other rice related to Punjab. Most of the data were obtained from the Economic Survey, Foreign Trade Statistics and Monthly Statistical Bulletin. The missing data were estimated using available information and appropriate methods. Average annual growth rates were estimated from indices (1980-81 = 100) of selected variables by using equation:

$$P_n/P_1 = (1+r)^n, \quad (1)$$

Where,

$$\begin{aligned} P_1 &= \text{value of a variable in the base year (1),} \\ P_n &= \text{value of a variable in the terminal year (n), and} \\ r &= \text{average annual growth rate.} \end{aligned}$$

Taking a natural log of equation (1) and replacing 'n' by 't', time trend (years 1 to 24) gives:

$$\ln(P_t/P_1) = t \ln(1+r) + e_t, \quad (2)$$

where,  $e_t$ , is an error term with conventional properties.

## 5. EMPIRICAL ANALYSIS

### 5.1 Production and Prices

Average annual growth rates for area, yield, production, crop area shares and domestic prices, in PRS and US\$, are presented in Table 2. These along with temporal indices, based on data given in Annexes-I and II, are depicted in Figure 1.

**Table 2**  
**Growth in Area, Yield, Production, Area Shares and Domestic Prices: 1980-81 to 2003-04**

**Per cent per annum**

Crops	Area	Yield	Production	Area share in total	Price	
					PRS	US\$
Wheat	0.88	1.48	2.37 (63%)	-0.16	7.45	-0.71
Rice	0.71	0.80	1.01 (53%)	-0.33	7.46	-0.70
Cotton	1.81	3.10	4.96 (62%)	0.76	5.90	-2.14
Sugarcane	1.02	0.85	1.21 (45%)	-0.02	5.49	-2.52

Notes: i) Figures in parentheses are shares of yield in growth rate of production.  
ii) Growth in price of rice relates to basmati, while that for others is very close to it.

Production of wheat and cotton increased, mainly due to yield, at about 2.4 and 5 per cent per annum, respectively. Rice and sugarcane, requiring irrigation and other inputs intensively, exhibited about one per cent annual growth in production. An overall technical break-through, predominantly for wheat and cotton, is noted from Figure 1 (left side). Cotton competes directly with rice and indirectly with wheat due to its harvesting extended beyond sowing season for wheat. Thus, it availed increased share in area prominently at the expense of rice instead of wheat. However, crop substitution, motivated by techno-economic factors, occurred in cotton belt only. Sugarcane is a balancing cash crop and experienced a little change in its area share.

Domestic prices, in PRS, increased by about 5.5 to 7.5 per cent per annum, but declined by about 0.7 per cent (wheat and rice) and 2.5 per cent (cotton and sugarcane) per annum in US\$. Had these remained unregulated and let free to adjust as per market forces, situation would have been worse. Further, technical break-through and crop substitution absorbed pricing shocks.

## 5.2 GDP, Exports and Public Debts

Actual and comparative (viz-a-viz GDP and all exports) growth rates for export earnings and public debts, using data (in US\$) given in Annex-III, are provided in Table 3 and depicted in first two rows of Figure 2. Temporal indices of GDP and exports (all) viz-a-viz selected exports and debts are also depicted in rows 3 & 4 and 6 & 7 of Figure 2, respectively.

**Table 3**  
**Overall Growth Rates and Volumes of Different Variables in the Base and Terminal Years**

Items	Growth rates (Actual)	As per cent of GDP			As per cent of Exports (All)		
		Growth rates	Comparative volumes		Growth rates	Comparative volumes	
			1980-81 <sup>a</sup>	2003-04 <sup>a</sup>		1980-81 <sup>a</sup>	2003-04 <sup>a</sup>
<b>GDP</b>	4.62	0	NA <sup>c</sup>	NA	NA	NA	NA
<b>Exports</b>							
i) All	5.83	1.15	10.52 (1) <sup>b</sup>	13.86(1.32) <sup>b</sup>	0	NA	NA
ii) Rice	-1.53	-5.88	2.01 (1)	0.47 (0.23)	-6.95	19.13 (1)	3.40 (0.18)
iii) Cotton	5.10	0.45	3.51 (1)	3.91 (1.11)	-0.69	33.34 (1)	28.23 (0.85)
<b>Public Debts</b>							
i) Internal	8.61	3.85	22.46 (1)	55.57 (2.47)	2.63	213.39 (1)	397.62 (1.86)
ii) External	6.34	1.64	40.40 (1)	59.65 (1.48)	0.48	383.81 (1)	430.43 (1.12)

**Note:** a) Actual in the year 1980-81 and for 2003-04 worked out using the growth rates.

b) Figures in parentheses are standardized to make intra-variable comparison of terminal year (2003-04) by considering base year (1980-81) as unity.

c) NA stands for not applicable.

Average annual growth in cotton group was about 5 per cent and a decline of 1.5 per cent for rice. Thus, economic significance of a commodity's potential for value addition and product diversification is established for policy formulation. Growth of GDP and export earnings (all), in actual terms, was about 4.6 and 5.8 per cent per annum, respectively. However, internal and external debts grew more rapidly than GDP and exports, which implies that borrowing was not encouraging for economic development.

To examine economic significance of growth rates discussed above, selected exports and debts as per cent of GDP and all exports are also given in Table 3 and left side of rows 4&7 in Figure 2 for an inter-variable comparison. Standardized form (given in parentheses) of the same, in terminal and base years, are shown in Table 3 and depicted in right side of said rows of Figure 2 to examine intra-variable performance in temporal context. Indeed debts dominated the scene and internal debt increased more rapidly than the external one. As compared with 1980-81, exports (all) and those of cotton as per cent of GDP showed a considerable increase in 2003-04, but reduced drastically for rice. As per exports (all), cotton showed a marginal decline, but that of rice became more prominent, which signifies value addition character of the former.

### 5.3.1 Analysis of Export Commodities

Data on export quantities, prices and earnings, in US\$, are provided in Annexes IV and V and used to estimate average annual growth rates, which are set out in Table 4. Information for an overall comparison of export quantum and foreign exchange earnings from rice and selected cotton commodities in 2003-04 as compared with 1980-81 is also provided in Table 4. These results and year-wise indices of export quantities and prices are depicted in Figure 3.

**Table 4**

#### Overall Growth Rates, Quantum and Export Earnings in the Base and Terminal Years

Commodities	Quantities			Prices		Earnings	
	Growth rate (%)	'000' MT/M.Sq.Meters		Growth rate (%)	Growth rate (%)	US\$ Million	
		1980-81 <sup>a</sup>	2003-04 <sup>a</sup>			1980-81 <sup>a</sup>	2003-04 <sup>a</sup>
<b>Rice</b>							
i) Basmati	0.86	409(1) <sup>b</sup>	502(1.19)	-2.17	-1.33	293 (1)	212(0.74)
ii) Others	1.29	835(1)	1135(1.36)	-3.17	-1.92	273 (1)	171(0.65)
<b>Cotton</b>							
i) Lint	-7.80	325 (1)	46(0.17)	-2.06	-9.70	525 (1)	45(0.10)
ii) Yarn & thread	9.53	98(1)	875(8.58)	0.01	9.55	217 (1)	1936(8.70)
iii) Cloth	6.13	501(1)	2088(3.93)	2.37	8.64	241 (1)	1763(6.72)
iv) Waste	21.50	3(1)	289(96.3)	-2.02	19.05	2 (1)	126(63.0)

Note: a) Actual in the year 1980-81 and for 2003-04 Worked out using the growth rates.

b) Figures in parentheses are to make intra-commodity comparison of terminal year (2003-04) viz-a-viz standardized (unit) base year (1980-81).

For basmati and other rice, declining prices outweighed quantum increases and led to reduced earnings. Production of yarn, thread and cloth was promoted during the Sixth Five Year Plan 1983-88 for value addition, income, employment and increased export earnings. Therefore, lint exports and earnings declined by about 8 and 10 per cent per annum, respectively. Yarn and thread, a raw material for overseas textile industry, enjoyed more than 9 per cent increase in exports and earnings due to stable prices. Cloth's quantity, price and earnings increased by more than 6, 2 and 8 per cent per annum, respectively. A sharp increase in cloth exports in the latest seven years faced a drastic price decline (Figure 3). Export of textile waste, a by-product of value addition process, recorded the highest growth rate of about 22 per cent per annum, but at a *microscopic* and declining price (Figure 3). Overall, its quantum and earnings went up by 96 and 63 times, respectively, which seems to be out of proportion as compared with refined products.

### 5.3.2 A Shift Over from Primary to Manufactured Commodities

Rice and cotton (lint) are treated as primary, while the rest are treated as manufactured commodities. Average annual growth in their quantities, prices and earnings are given in Table 5 and temporal indices, etc. are depicted in Figure 4. Quantities and prices of primary commodities recorded an increase of 0.61 per cent and a decline of about 4 per cent per annum, respectively. On the other hand, export of manufactured commodities registered an annual growth of more than 7 per cent in quantum and 2 per cent in price. This change was also noted in the respective earnings and export shares. In temporal context, investment made in agriculture [Ellahi (2002)] brought a technical break-through to enable investing for value addition. Potential of these policies seems having been reaped adequately and additional commodities needs to be covered.

**Table 5**

#### Growth in Primary and Manufactured Exports: 1980-81 to 2003-04

Percent per annum

Variables	Primary Commodities <sup>a</sup>	Manufactured Commodities <sup>b</sup>
i) Quantity	0.61	7.09
ii) Price	-3.79	2.01
iii) Earnings	-3.21	9.25
iv) Export shares	-8.54	3.23

### 5.4 Implications for Labour Wages

Seasonal nature of work for conventional crops, where unskilled labour is employed, has a few peaks, many troughs and implications for wages and employment, which is not true for urban jobs. Thus, analysis of rural wages may not precisely help to understand the extent of rural poverty as compared with the urban one. Over-time average annual growth in rural and urban wages (Annex-II) is given in Table 6, which along with wage indices are depicted in Figure 5.

**Table 6**

#### Growth in Wages for Unskilled Labour: 1980-81 to 2003-04

Per cent per annum

Type of Labour	<u>Wages</u>	
	PRS	US\$
Rural Labour	8.48	0.24
Urban Labour	7.96	-0.24

Nominal wages in both rural and urban areas increased at about 8 per cent per annum, but in US\$ it was close to zero. A salient observation is that over-time wage increase compared well with that in the regulated domestic prices, but real wage remained almost stagnant.

### 5.5 A Summary of Findings for Policy Analysis

An overall picture of the scenario described above is provided in right side of Figure 6. It shows that a heavy reliance on traditional commodities pushes prices down even below the equilibrium level. Quantity poured into the market exceeds supply curve ( $Q_s$ ), which represents marginal cost as well. Thus, production and exports should be adjusted accordingly. Left side of Figure 6 relates to non-traditional commodities priced above the equilibrium level determined by an interaction between demand ( $Q_d$ ) and supply ( $Q_s$ ) forces. Producers may expand output up to intersection of supply curve at the going price which ultimately settles at the equilibrium. If available avenues are not explored, it leads to a deficit!

## 6. CONCLUSIONS AND POLICY RECOMMENDATIONS

Analysis showed that poverty, in general and rural poverty in particular, aggravated in spite of growth-oriented policies for primary and manufactured commodities. It is concluded that poverty is not only influenced by local conditions but also affected by economic atmosphere across international borders. Another feature of these policies is a heavy reliance on traditional commodities beyond economic limits. Thus, declining real prices/wages *enriched* poverty.

However, if quantum of commodities in production mix is adjusted according to the economic principles, real factor incomes may go up and reduce poverty. In the light of changing economic atmosphere it may safely be suggested that adjustment process may not be limited to crop sub-sector only but should also focus on others. It may involve shifting to non-traditional commodities, such as fruits, vegetables, beef, mutton, dairy, livestock, poultry, fisheries, etc. The *modus operandi* for this change may involve resource reallocation for optimal production of commodities through an expert consultative mechanism. This may help to smooth up seasonal nature of rural employment, raise real wages, check labour exodus and increase general welfare. In essence, policy focus needs to be redirected to make the existing set-up stable, sustainable and develop new strategies both to invest in and for agriculture in the interest of value addition.

## Annex-I

## Area, Yield and Production of Major Crops: 1980-81 to 2003-04

Year	Wheat			Rice			Cotton			Sugarcane		
	Area	Yield	Production	Area	Yield	Production	Area	Yield	Production	Area	Yield	Production
1980-81	6.98	1.64	11.48	1.93	1.62	3.12	2.11	1.99	4.20	0.83	39.22	32.36
1981-82	7.22	1.57	11.30	1.98	1.73	3.43	2.21	1.99	4.40	0.95	38.50	36.58

Source: i) Economic Survey, various issues, for support prices and urban wages.

ii) Monthly Statistical Bulletin for rural wages from 1983-84 to 1996-97. For rest of the years, rural wages was estimated using information on urban wages.

Notes: a) Support prices for commodities were fixed in PRS and converted into US\$ by using exchange parity between these currencies.

b) Support prices for rice (clean) were not announced from 1997-98 and afterwards. It was also the case for cotton (lint). Therefore, support prices for the indicated years were estimated on the basis of same for rice (paddy) and cotton (phutti) considering their relationship with the counterparts in the preceding years.

c) Support prices for wheat, rice (clean) and cotton (lint), wherever in decimals, are rounded to whole figures.

d) Urban wages are an average of daily wages prevailing in the cities, namely Lahore, Karachi, Peshawar, Quetta, Rawalpindi and Islamabad given in the Economic Survey.

e) Daily wages, given in PRS, were converted into US Dollars by using exchange parity of the respective currencies.
